

Eyeliner Tattoo Aftercare Instructions

Congratulations on your new eyeliner tattoo! Proper aftercare is crucial to ensure the best healing results, colour retention, and comfort. Please read and follow these instructions carefully.

What to Expect

- Day 1–2: Eyes may feel slightly tight, swollen, or tender — this is completely normal. Some clients experience mild watering or a puffy feeling.
- Day 3–5: The colour may appear darker or thicker. Tiny flakes or light crusting may form along the lash line. Do not pick or rub these areas.
- Day 5–10: The colour may appear lighter or uneven as the skin exfoliates naturally. This is temporary — your true healed colour will gradually emerge over the next 4–6 weeks.
- 4–6 Weeks: The skin is fully healed. A touch-up session may be recommended at this point to perfect the result.

Aftercare Instructions

1. Keep the Area Clean

- Use MicroTonic by Membrane Post-Care as your only cleanser.
- Apply a few drops onto a clean wand or lint-free gauze.
- Morning and evening (and if eyes feel sticky or watery): lightly press or dab along the lash line — do not rub, scrub, or drag the skin.
- Allow the area to air dry. Do not apply any ointments, oils, or creams unless instructed by your artist.
- This product helps keep the area clean, reduces irritation, and supports calm, balanced healing.

2. Do NOT:

- Rub, scratch, or pick at any flakes or scabs.
- Apply mascara, eyeliner, lash serum, or any eye make-up for at least 10 days.
- Use cleansing wipes, micellar water, or facial cleansers around the eyes.
- Submerge your face in water (no swimming, saunas, steam rooms, or hot tubs) for 10–14 days.
- Expose your healing tattoo to direct sun or tanning beds.

- Use contact lenses for the first 24–48 hours (wear glasses if needed).

3. Manage Swelling or Discomfort

- Slight swelling or tenderness is normal for 24–48 hours.
- Apply a clean, cool compress (use a damp, cold cotton pad — not ice) for a few minutes at a time if needed.
- Sleep slightly elevated the first night to reduce puffiness.

4. Showering

You may shower normally, but avoid getting soap, shampoo, or water directly on your eyes. Let water gently run over your face without splashing, and pat dry carefully.

Healing Timeline

Day	What's Happening	What to Do
1–2	Slight swelling, tenderness	Clean gently with MicroTonic twice daily
3–5	Possible flaking/scabbing	Keep clean, hands off
5–10	Skin exfoliating, colour may fade temporarily	Continue cleaning; avoid make-up
10–14	Surface healed, skin stabilising	Resume normal skincare (avoid lash serums until fully healed)
4–6 weeks	Fully healed	Book touch-up if needed

Touch-Up Appointment

A perfecting session is typically needed 6–8 weeks after your initial procedure to refine shape, depth, and colour. Healing and retention vary by person, and your artist will assess your results at this stage.

Long-Term Care

- Always use sunscreen and sunglasses to protect your tattoo from fading.
- Avoid chemical peels, laser treatments, or exfoliants directly on the eyeliner area.
- Keep your lash line clean to maintain pigment longevity.

Important

If you experience redness or swelling that worsens after 3 days, yellow or green discharge, significant pain, or signs of infection, contact your artist immediately and seek medical attention if needed.

Recommended Product

Membrane MicroTonic Post-Care

- Supports healing, reduces redness, and cleanses gently
- Anti-inflammatory and antimicrobial properties
- Specifically formulated for delicate post-tattoo skin

Use only this product as directed by your artist. Do not substitute with other cleansers or ointments.
